About

Software engineer focused on backend development and cloud architecture. Experienced designing and operating event-driven systems, ASP.NET Core API services, and Azure infrastructure end to end — from networking and identity to CI/CD and observability. Always eager to explore new, challenging domains with an insatiable appetite to learn.

Skills

Languages	C#, SQL, Python, TypeScript, Shell (Bash, Nushell), Java, Solidity
Backend	.NET / ASP.NET Core, REST APIs, SQL Server, SSIS, Kafka, event-driven architecture
Cloud & DevOps	Azure (Container Apps, Front Door, Key Vault, Event Hubs, ACR, Data Factory, Bicep), Azure DevOps CI/CD, Docker, Kubernetes (AKS), Git, New Relic

Experience

Software Engineer | Aramark, Remote

Feb 2022 – Present

Aramark is an American food and facilities services provider with international operations. ENABLE+ is its iOS/Android platform for food servicing and inventory management.

- Spearheaded the design and implementation of a real-time push notification system on Azure, spanning Event Hubs, cloud services, and SQL Server stored procedures
- Core contributor to the development, deployment, and maintenance of an ASP.NET Core API web service
- Led the migration of a production application into a dedicated Azure subscription — rebuilding VNet/NAT Gateway networking, Container Apps, ACR, database, and static web app infrastructure
- Resolved production routing failures by consolidating Azure Front Door custom domains onto path-based routing (/api/* to API origin, /* to SPA)
- Built a synthetic canary observability pipeline with New Relic custom events to measure end-to-end push notification delivery outcomes
- Designed and optimized stored procedures for ENABLE+, improving data retrieval efficiency and guaranteeing deterministic, business-rule-aligned CSV exports
- Collaborated with an international Agile team to meet project deadlines and streamline deliverables

AKS Support Engineer | Microsoft, Remote

Dec 2021 – Feb 2022

Azure Kubernetes Service (AKS) is a managed Kubernetes service for container orchestration and cluster management.

- Troubleshoot and optimized AKS clusters, ensuring secure, efficient container orchestration and management
- Leveraged diagnostic tooling and root-cause analysis to resolve Sev B/C customer cases

Jr. Software Engineer / Technical Analyst | Fruitful Labs, Philadelphia, PA

Dec 2020 – Sept 2021

Fruitful Labs is a blockchain startup behind Love Boat Exchange, a decentralized cryptocurrency exchange deployed to the Ethereum and Polygon chains.

- Co-authored a collection of Solidity smart contracts for the ERC20 governance token LOVE
- Contributed to the development, deployment, and maintenance of the decentralized exchange AMM on the Polygon network
- Assisted in the technical research, documentation, and implementation of the first upgradeable EIP-2535 standard DEX, which reached \$250,000+ in initial total liquidity

Education

Backend, SQL & DevOps with Python | NuCamp, Remote

Aug – Dec 2021

B.S. Kinesiology, Minor in Neuroscience Research | Temple University, Philadelphia, PA

Dec 2020

- Co-authored a publication in the *European Journal of Neuroscience*
